MDT-400-34 (MILL DUTY THRUSTER BRAKES)

INTRODUCTION

Thruster Brake is a device to retard the speed of moving machinery and to stop it accurately to the desired position. The breaking force is applied to the brake shoes by a pre-stressed compression spring. The shoes press on the rotating brake drum retarding its speed, and finally stopping it.

SELECTION OF BRAKE SIZE

Electo-hydraulic thruster is a device which develops linear thrust (or force) required to operate the required mechanism. The input to the device is three phase supply.

The brake torque must be = > than motor full load as referred with drum. Formula as below:

- T = Torque in Kgm = $\frac{716 \text{ x Hp}}{\text{rpm}}$
- T = Torque in Nm = $\frac{9552 \times Kw}{rpm}$

Where Hp/Kw = motor output & rpm = Rev/minute
